OFFERINGS: SAP DATA LIFECYCLE MANAGEMENT

A key offering in SMC's SAP practice is our data life cycle services. These offerings entail a full treatment of data from creation to archiving within an SAP environment.

Services here entail:

■ **Enterprise Data Life Cycle Management**

Often data integrity becomes the reason for poor performance or project failure. To avoid such risks an organisation must implement an Enterprise Data Life Cycle Management strategy that is measurable and that conforms to **one version of the truth**.

■ **Data Quality**

To implement new wave technologies, data must be of a certain quality to achieve return on investment in the shortest possible time. Data Quality is the foundation to build accurate dashboards and KPI reports. The SMC Enterprise framework to achieve the specified quality levels is driven with your strategic direction in mind.

■ **Data Governance**

Data Governance is the underlying fundamentals of all work related to data including the goals of:

- Increasing consistency and confidence in decision making;
- Decreasing the risk of regulatory fines;
- Improving data security;
- Maximizing the income generation potential of data, and
- Designating accountability for information quality

Our Data Migration team can assist your organisation in realising these goals by the implementation of Data governance programs and initiatives.

■ **Data Migration**

Data cleansing and Migration is an integral part of any SAP implementation. It requires a thorough knowledge of SAP data structures and an appreciation of the external sources of system information. During the Data Migration process it is necessary to review the clients' existing data, identifying and removing errors and clarifying inconsistencies.

We utilise the ASAP methodology with a toolset and project plan refined over many projects. This ensures a Specific, Measureable, Accurate, Realistic and within Time data migration of all relevant legacy data.

Reconciliations are left to the last phase of the project. SMC Enterprise builds this component as part of the project plan and gives it as much focus as the field-to-field mapping and forms part of the Data Migration Strategy.

■ **Data Archival**

Data archiving focuses on effective data management and has two major purposes - system load reduction and legal/ compliance support.

Both use the same process analysis and categorisation; the archiving process itself, and access to archived data. Benefits include increased system availability, better use of resources, improved system performance and compliance to retention laws.

■ **Implementations**

SMC Enterprise can manage the entire Data Life Cycle within any SAP implementations, upgrade; roll-out and support phase. We have specialised Data Migration Consultants that are well versed with the process.
